Construction software for the whole company.

A construction company depends on several departments. Sales needs customer history and estimates. Crews need schedules, instructions and materials. Accounting needs the records behind the spending.

Usatii brings those functions into one web workspace and mobile app. It combines CRM, measurement, estimating, work management, inventory, accounting, communications, training and AI.

The practical difference is what each team can use next: reviewed quantities for an estimate, a saved proposal in the customer record, or a revised dispatch that the installer must acknowledge.

Construction project coordination

The office & field work Usatii brings into one workspace.

The office, the field & the financials.

The suite covers the daily work of running a construction company. Each team has its own tools, with permissions that control the records and actions available to its users.

Sales & customer management

Keep appointments, conversations, photos, documents and job history with the customer. Review sales recordings against scripts, identify objections and assign follow-up. BidOps tracks bid requirements, deadlines and outstanding questions.

Measurement & estimating

Capture a property, correct the geometry and review quantities before pricing the work. Select products from the company catalog, compare estimate packages, generate proposals and request signatures.

Project & field management

Work Flow organizes tasks, people, dates, files and related records. Installers scheduling assigns crews to jobs; dispatch adds arrival times, instructions and stops. The mobile app lets crews respond and record job evidence.

Materials, time & accounting

Inventory records item locations, quantities, condition and movement. Timecards record job time and travel. QuickBooks links give accounting a source to inspect when reviewing spending and job costs.

“Dispatch revisions show us which installers still need to acknowledge the changed instructions.”

ORLANDO TOWN CONSTRUCTION

AI works across the suite

Ask AI to find records, prepare catalog selections or plan an estimate using saved customer information. Permission checks apply to its tools; financial changes are prepared for approval.

Conversations & schedules

Calls, messages, live chat and notes support follow-up. Calendar manages meeting times and participants. Library holds the documents teams need to find and attach to their work.

Training & coaching

Course Builder publishes lessons and quizzes. Academy assigns courses and records progress. Sales and installer reviews keep the source conversation available alongside findings and next actions.

Administration & oversight

The dashboard reports usage, traffic, errors and system activity. Audit records show actors and changes. Administrators manage departments, access, devices, two-factor authentication and hardware keys.

> **“We can review product selections and quantities before saving the estimate used for the proposal.”**
>
> REBUILDIT INC.

From property capture to a reviewed estimate.

Start with the property

Measure accepts plan inputs and supported Apple RoomPlan capture. The record holds spaces, walls, openings and source assets, so the estimator can return to the evidence behind a quantity.

Correct before you release

Save geometry corrections with reasons and supporting evidence. A reviewer can approve the result or request recapture. Reviewed quantities can then be released for takeoff and estimate use.

Build the offer from real products

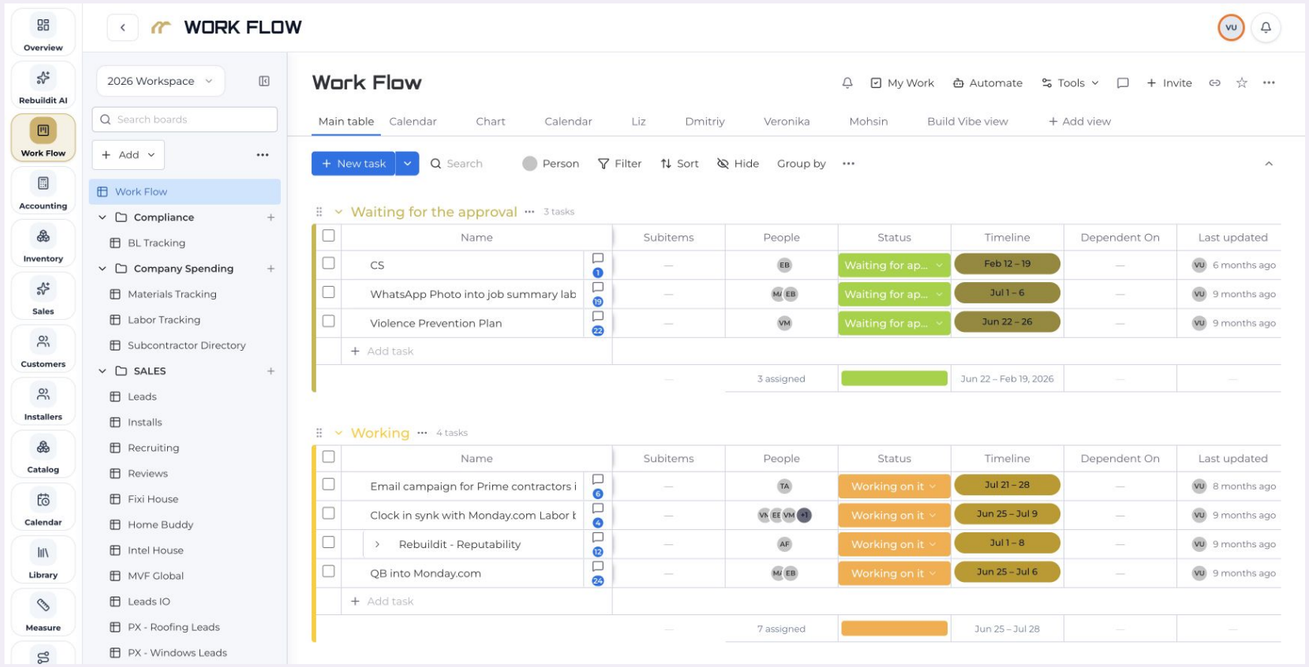

Catalog supplies product options and pricing. Sales Expert can prepare Good, Better and Best packages, check required scope and identify exclusions. Saved estimates supply the values used in proposals.

From plans to construction

Site measurements & scope underpin the estimates teams prepare in Usatii.

> **“Crew members can acknowledge the current dispatch and report a blocker against that assignment.”**

Work Flow in use.

Actual Work Flow screen from REBUILDIT INC. Tasks, assignees, status and dates remain visible in the same board.

Keep the customer history useful

The conversation does not end when an estimate is saved. Customers keeps appointments, notes, measurements, proposals, agreements and signatures together. The next person can open the record and see what has already happened.

Turn the decision into assigned work

Work Flow gives the team a place to assign tasks, set dates, attach files and connect related records. Table, calendar and other saved views let people inspect the same work from the view they need.

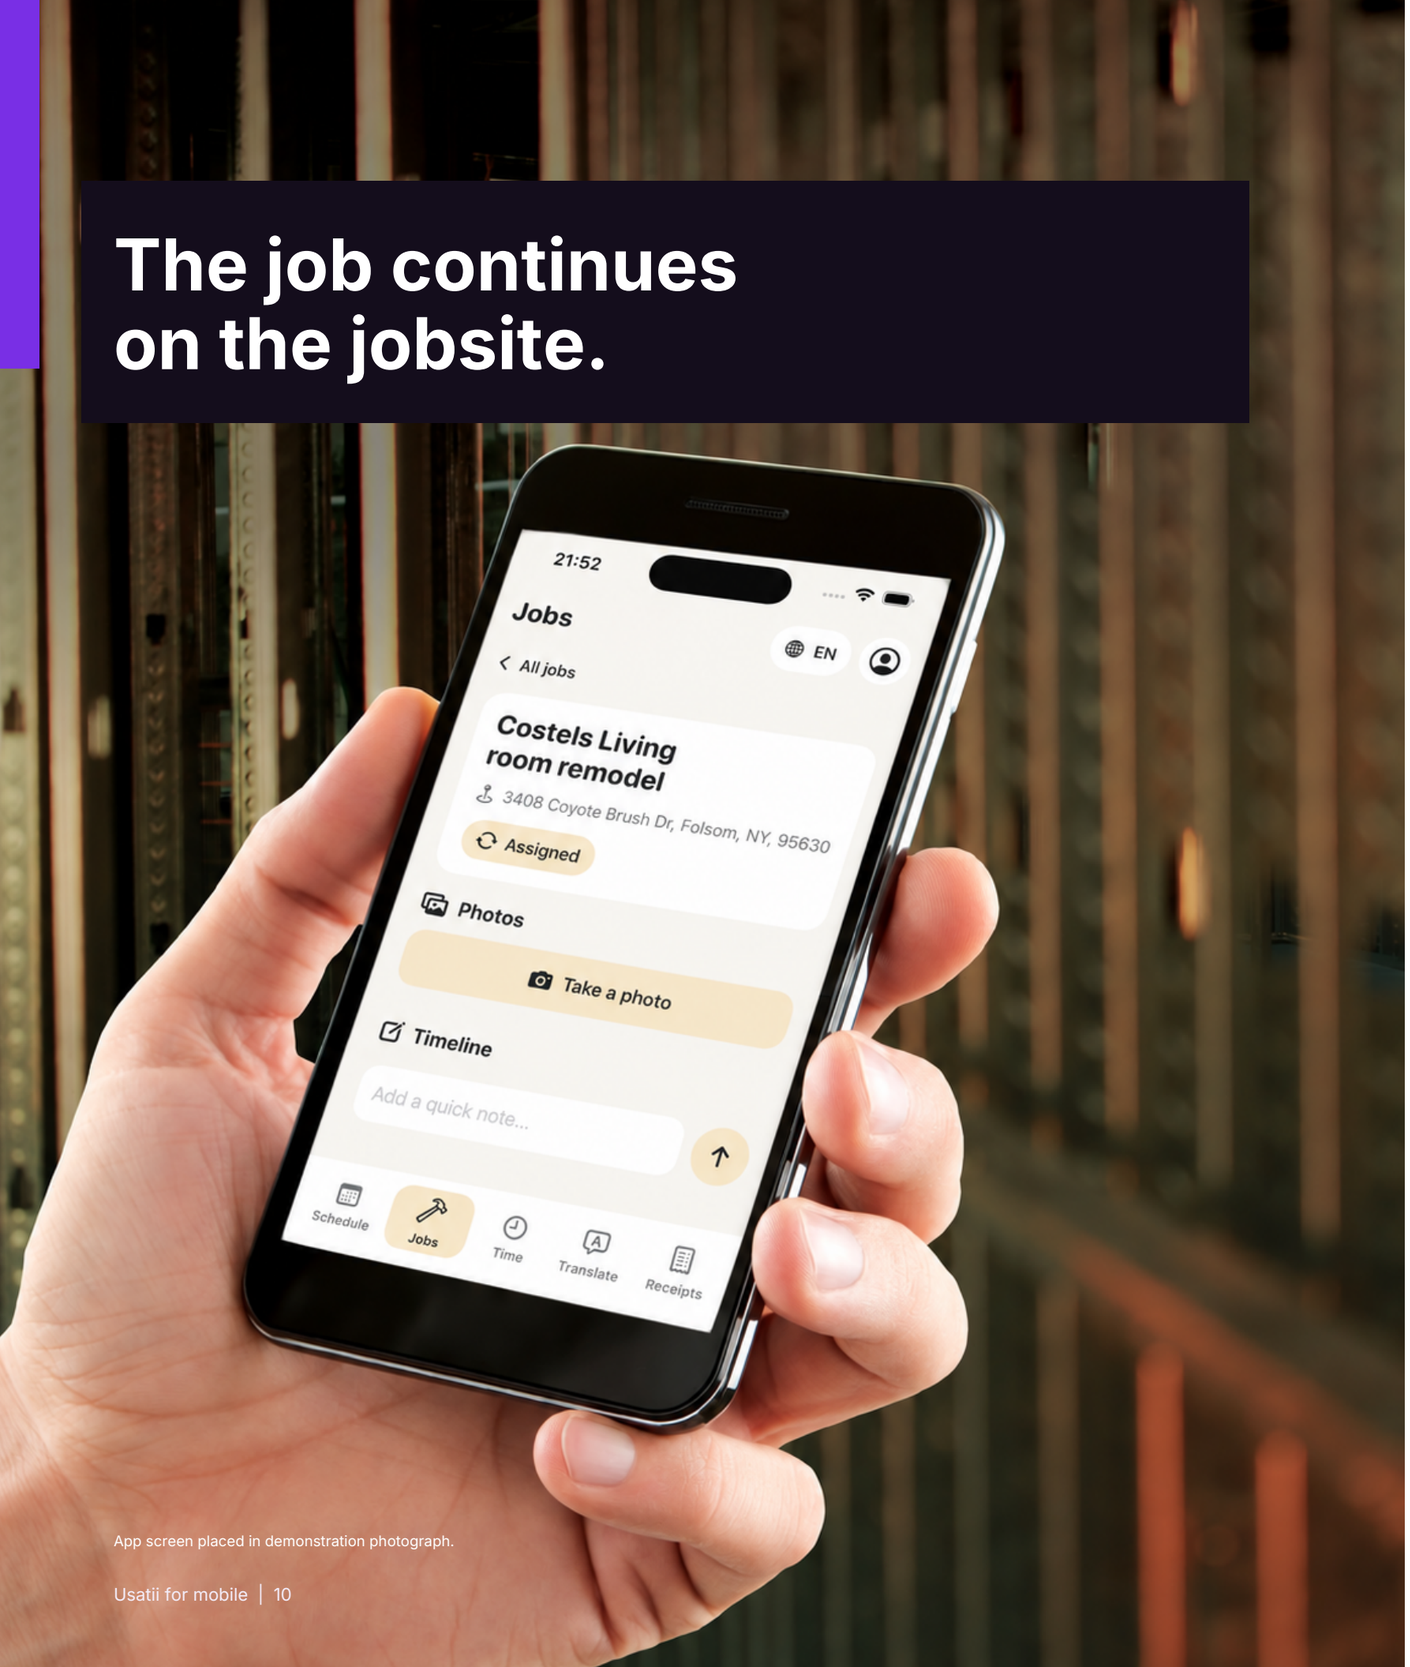

Give the crew the current instructions

Scheduling assigns people to jobs. Dispatch adds the responsible managers, arrival times, tasks, pickup instructions and delivery stops. Crews can acknowledge the instructions or report a blocker.

Make changed instructions visible

A revised dispatch needs a new acknowledgment. Managers can distinguish a response to an earlier version from acceptance of the current instructions, then follow up with the people still outstanding.

The job continues on the jobsite.

App screen placed in demonstration photograph.

Open the assigned job

Employees, installers and customers enter through their respective app paths. Authorized users can open the jobs, tasks, files, calendar events and tools available to their role.

Record what happened

On the job screen, take a photo or add a timeline note. Uploads attach evidence to the selected record. The office can review the saved information when following up on the work.

Account for materials & time

Installers can scan inventory barcodes and record item movement. Clock events retain the person, job and time. Regular time, travel and lunch records support the later pay review.

Respond to the schedule

Read dispatch instructions, acknowledge the current revision and report progress or a blocker. Scheduling, notifications, live chat and calls give the crew ways to coordinate from the field.

Bring site capture back to the office

Supported devices capture interior geometry with RoomPlan. Capture drafts and eligible uploads can queue for retry after a connection failure. Measurement review, editing and estimate handoff require service.

“Installers can open the assigned job, take photos and add notes to its timeline.”

REBUILDIT INC.

Know what the job cost.

Follow the number back to the work behind it.

A job cost is only useful when the team can inspect what went into it. Usatii combines recorded labor, materials and cost information with explicitly linked QuickBooks transactions for review.

Accounting can examine transaction lines, sync status and exceptions. Pay estimates use effective rates and overtime rules. Missing rates remain unpriced, and unsupported accounting amounts stay visible as exceptions.

See where each cost came from

QuickBooks links identify the customer or job behind a transaction. Reconciliation checks avoid counting a transaction total and its allocated lines twice. A sales-minus-cost subtotal is not presented as final profit.

Connect the systems you still need

Work Flow can reference supported business records and external platforms. Existing board structure and records can be read for migration. Provider connections and import scope are checked during implementation.

Use AI with the records already saved

AI can find accessible work, read customer context and prepare supported actions across the suite. The value is specific: use the customer brief, measurement and catalog when preparing the next estimate.

Review changes before they happen

AI tools run within the user’s permissions. Financial and other high-impact changes require approval. A changed source record can invalidate a proposal before execution; audit records preserve the action and actor.

“The accounting view lets us inspect the linked transaction and the exceptions behind a subtotal.”

REBUILDIT INC.

What procurement can verify

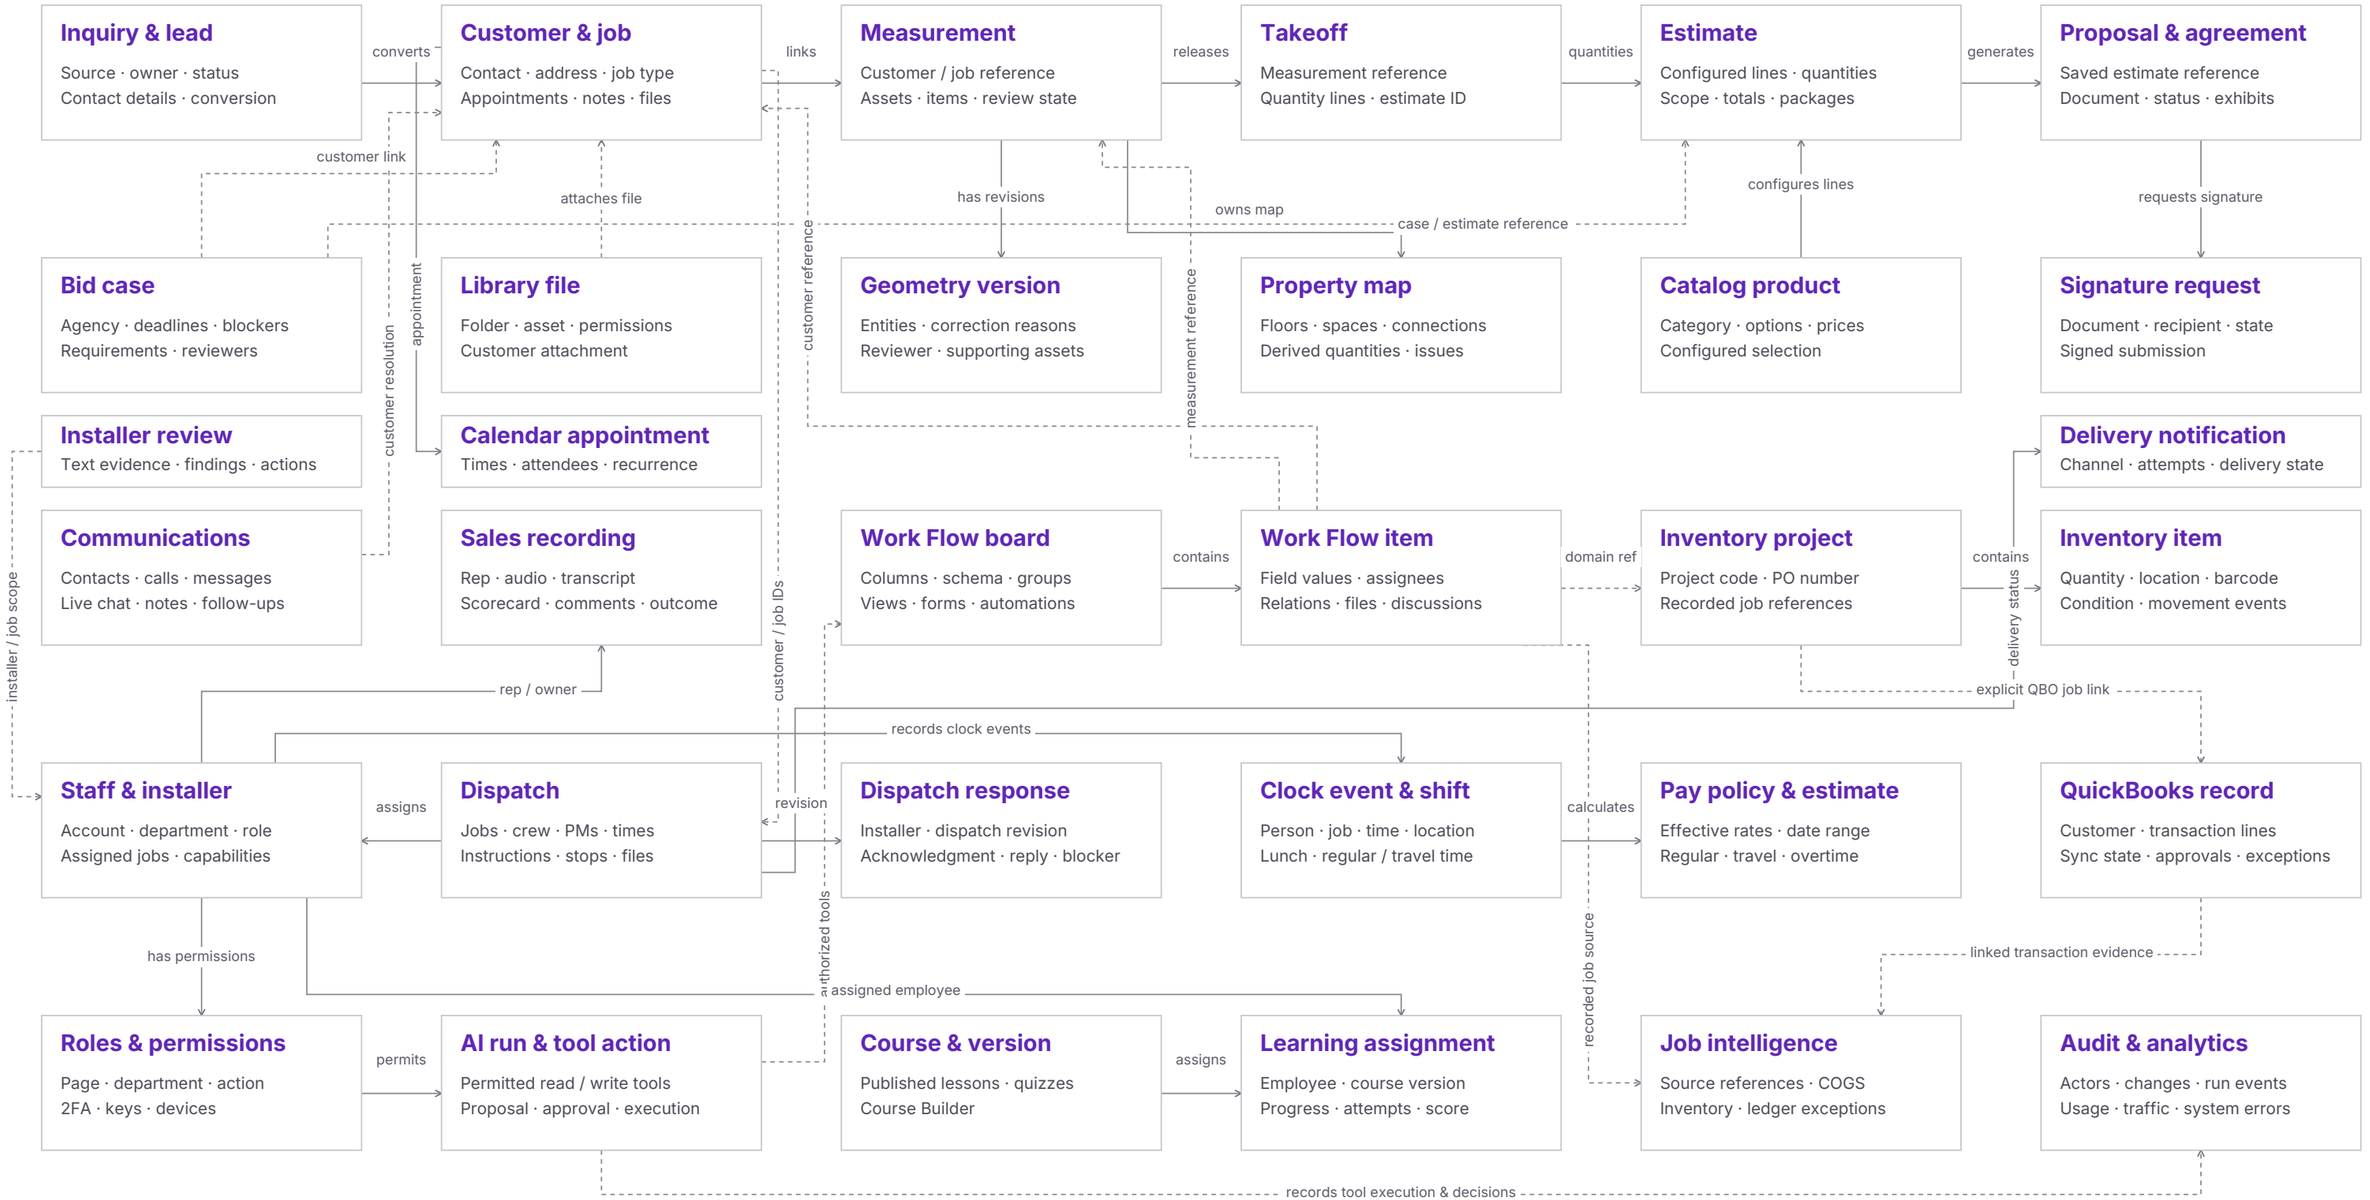

Required modules, user access, source-system links, device support, approval rules & deployment costs.

Capabilities reflect the inspected web and iOS implementations. Availability depends on release, role, device and provider configuration. Confirm implementation scope and commercial terms with Usatii.

How the platform connects

Read across for measurement to proposal; follow the links for crews, materials, costs, training & AI.

Solid: ownership or operation Dashed: explicit reference, attachment or permission-controlled access

Managing work across properties

Property projects bring together schedules, people & tasks in Usatii.

Nine searches. 0.762 seconds.

In the published test, Work Flow completed nine task searches in 0.762 seconds: 5.5× faster than the comparison run.

TASK LOOKUP TEST

Usatii Work Flow

0.762 seconds

monday.com

4.217 seconds

Median time to complete the same nine-query sequence.

WHAT WAS TESTED

Five paired runs

Same computer; product order alternated.

Nine consecutive queries

Three shared task titles repeated in each run.

Correct results

45 of 45 expected single-task results per product.

HOW TO READ IT

Warm boards

Both boards were loaded before timing.

End-to-end timing

Includes automation and rendered-result verification overhead.

A specific workload

Not a test of AI, scale, cold starts or overall platform speed.

Measured sequence: 4.217 ÷ 0.762 = 5.5×

Start with the way your company works.

Bring a real job, the tools your team uses today and the people responsible for the work. A walkthrough can establish what belongs in Usatii, what needs to connect and what each department needs to see.

Put the workflow into practice

1

Map the current work

Follow a customer from the first conversation through estimating, scheduling, field updates and cost review. Identify the people and records involved.

2

Set up the company workspace

Configure boards, product categories, pricing and library documents. Assign department and page access to the people who need it.

3

Bring across the records

Review supported imports, including existing monday.com boards. Connect the required providers and verify customer, job and QuickBooks references.

4

Teach the work in the software

Publish company lessons with Course Builder and assign them in Academy. Practice the estimate, dispatch and field workflows with the people who will use them.

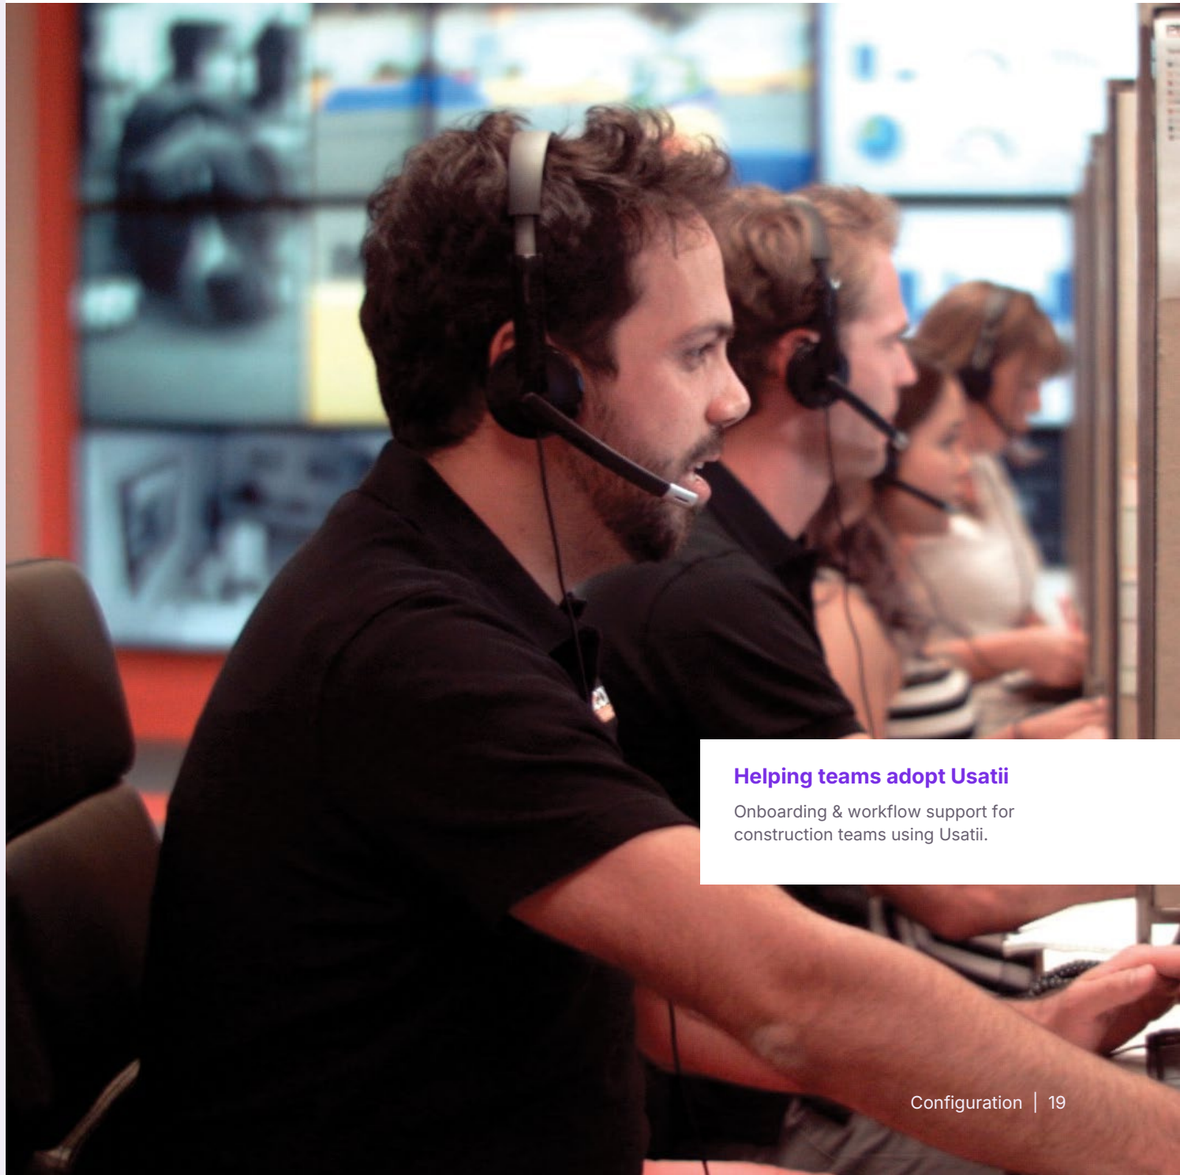

5

Review a complete example

Check the saved estimate, crew responses, uploaded evidence and accounting exceptions. Resolve missing information before adding more teams or workflows.

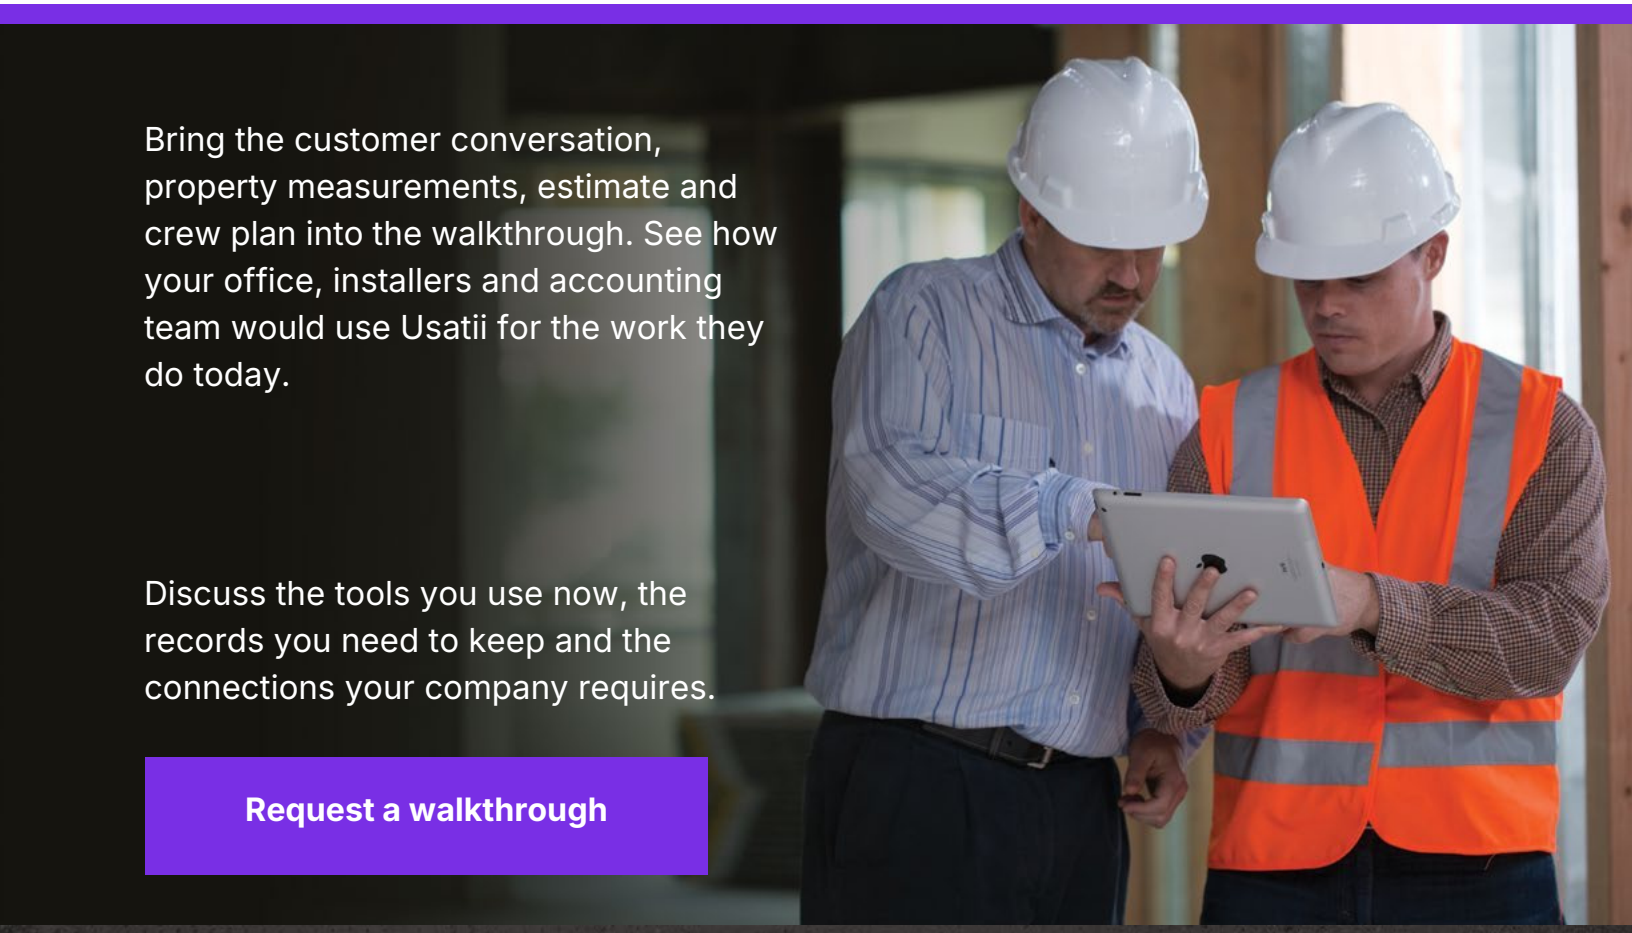

“We can assign a published course and review the employee’s recorded lesson progress.”

ORLANDO TOWN CONSTRUCTION

Helping teams adopt Usatii

Onboarding & workflow support for construction teams using Usatii.

Bring the customer conversation, property measurements, estimate and crew plan into the walkthrough. See how your office, installers and accounting team would use Usatii for the work they do today.

Discuss the tools you use now, the records you need to keep and the connections your company requires.
